7 Multiple Parameters / Arguments

8 Void (Non-Fruitful) Functions

Python Functions

- There are two kinds of functions in Python:
 - **Built-in functions** provided as part of Python, such as `print()`, `input()`, `type()`, etc.
 - **User-defined functions** which are created by the programmer.
- Function names are treated as "new reserved words."

Function Definition

- A function is reusable code that takes arguments, performs a computation, and returns a result.
- Defined using the `def` keyword.

- 1 Functions
- 2 Build Your Function**
- 3 Definition and Uses
- 4 Arguments
- 5 Parameter
- 6 Return Values
- 7 Multiple Parameters / Arguments
- 8 Void (Non-Fruitful) Functions

Build Your Function

- Functions are defined with the `def` keyword and optional parameters in parentheses.
- Example:

```
1 def greet(name):  
2     return "Hello, " + name + "!"
```

- 1 Functions
- 2 Build Your Function
- 3 Definition and Uses**
- 4 Arguments
- 5 Parameter
- 6 Return Values
- 7 Multiple Parameters / Arguments
- 8 Void (Non-Fruitful) Functions

Definition and Uses

- After defining a function, it can be invoked multiple times.
- This is known as the "store and reuse" pattern.

- 1 Functions
- 2 Build Your Function
- 3 Definition and Uses
- 4 Arguments**
- 5 Parameter
- 6 Return Values
- 7 Multiple Parameters / Arguments
- 8 Void (Non-Fruitful) Functions

Arguments

- Arguments are values passed to a function.
- Example:

```
1 largest = max(3, 7, 2, 5)
2 print(largest) # Output: 7
```

- 1 Functions
- 2 Build Your Function
- 3 Definition and Uses
- 4 Arguments
- 5 Parameter**
- 6 Return Values
- 7 Multiple Parameters / Arguments
- 8 Void (Non-Fruitful) Functions

Parameter

- A parameter is a variable in the function definition that refers to an argument during function calls.
- Example:

```
1 def square(number):  
2     return number * number
```

- 1 Functions
- 2 Build Your Function
- 3 Definition and Uses
- 4 Arguments
- 5 Parameter
- 6 Return Values**
- 7 Multiple Parameters / Arguments
- 8 Void (Non-Fruitful) Functions

Return Values

- `return` sends a value back to the caller.
- Example:

```
1 def add(a, b):  
2     return a + b
```

- 1 Functions
- 2 Build Your Function
- 3 Definition and Uses
- 4 Arguments
- 5 Parameter
- 6 Return Values
- 7 Multiple Parameters / Arguments**
- 8 Void (Non-Fruitful) Functions

Multiple Parameters / Arguments

- Functions can take multiple parameters.
- Example:

```
1 def multiply(x, y):  
2     return x * y
```

- 1 Functions
- 2 Build Your Function
- 3 Definition and Uses
- 4 Arguments
- 5 Parameter
- 6 Return Values
- 7 Multiple Parameters / Arguments
- 8 Void (Non-Fruitful) Functions**

Void (Non-Fruitful) Functions

- Void functions do not return a value.
- Example:

```
1 def greet(name):  
2     print("Hello, " + name + "!!")
```

- 1 Functions
- 2 Build Your Function
- 3 Definition and Uses
- 4 Arguments
- 5 Parameter
- 6 Return Values
- 7 Multiple Parameters / Arguments
- 8 Void (Non-Fruitful) Functions

Advantages

- Organize code into logical chunks.
- Avoid repetition by reusing code.

End of Functions
